WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatism other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease." The presence of Ports of Embarkation and of large numbers of casals admitted should be borne in mind in making comparisons between Service Commands and individual stations.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 27 October 1944, the admission rate from all causes remained at virtually the same level as during the previous two weeks (569 per year per thousand strength). This rate is about 20 percent lower than for the corresponding week of 1943. Morbidity from disease likewise remained substantially the same as during the previous week.

The admission rate from injury decreased from 65 to 63 per thousand, which is the lowest rate reported so far this year except that for the week ending 1 September. It is believed that the current relatively low level reflects compliance with the recently issued directive regarding reportable injuries; this clarification provided that readmitted cases and injuries existing prior to entry into active service should be reported as "disease" rather than as "injury." Because of this, it may be anticipated that the injury admission rate for some weeks to come may show more of a downward tendency than would otherwise have prevailed.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased (for the first time in the last five weeks) from 95 per thousand the previous week to 92 per thousand for the current week. The admission rate for the current week is 10 percent lower than for the corresponding week of 1943.

The admission rate from pneumonia increased from 9 per thousand to 10 per thousand and was at the highest point since the end of May. Morbidity from this cause was at about the same level as during the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service increased from 38 per thousand to 41 per thousand for the current week. This increase reflects the seasonal pattern

within each month that has prevailed previously—namely that morbidity from these causes is lowest during the first week of the month and gradually increases, being highest for the last week of the month. The admission rate from these causes is over 40 percent higher than for the corresponding week of 1943.

Morbidity from diarrhea and dysentery decreased to 7 per thousand for the current week, which is the lowest rate reported since the end of April.

The number of new cases of meningitis reported was 23 or at about the same level as has prevailed during recent weeks. The number of new cases of rheumatic fever decreased sharply to 42, or only slightly above the minimum figure of 40 which was reported during the week ending 13 October. During the current week the new cases of poliomyelitis numbered 5 as compared with 12 for the preceding week.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rate from disease continued the same in most of the Service Commands. In the First and Fifth Service Commands sizeable decreases were recorded, while significant increases occurred in the Sixth and Eighth Service Commands.

The Second Service Command continued to report the highest morbidity from all causes (704 per thousand) and from disease (654 per thousand). The lowest morbidity from all causes (535 per thousand) and from disease (463 per thousand) was again registered in the Eighth Service Command which for several months has reported very low morbidity.

Decreases of 20 percent or more in morbidity from injury were reported by the First and Fifth Service Commands, while increases of about 10 percent were registered in the Sixth, Seventh, and Ninth Service Commands. Only the Eighth Service Command with a rate of 72 per thousand reported morbidity from this cause in

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

excess of 70 per thousand.

Respiratory Causes:

The admission rate from colds, influenza, etc. decreased in all Service Commands except the Sixth and Eighth; the greatest decreases were recorded in the Third and Seventh Service Commands and the Military District of Washington.

The Second Service Command reported the highest morbidity from colds, influenza, etc. (134 per thousand), followed by the Military District of Washington (129 per thousand). The Fourth Service Command reported the lowest morbidity from these causes (80 per thousand).

Morbidity from pneumonia remained about the same in most Service Commands; however, significant increases did occur in the Third and Fourth Service Commands and the Military District of Washington. The Sixth Service Command with a rate of 19 per thousand, or almost double that for the country as a whole, reported the highest morbidity from this cause.

Common Communicable Diseases:

Morbidity from "new" venereal (excluding EPTS) cases increased in the majority of the Service Commands; the Third, Sixth, and Ninth Service Commands reported increases of more than 20 percent. The Second Service Command reported the highest morbidity from these causes (63 per thousand), followed by the Fifth Service Command (60 per thousand). The high experience of the Second Service Command is due to the presence of task force troops not under its jurisdiction.

Most Service Commands reported relatively low morbidity from diarrhea and dysentery, the highest rate (10 per thousand) being reported by the Eighth Service Command.

NON-EFFECTIVE RATE

The non-effective rate increased for the fifteenth consecutive week to 48.5 per thousand; this is the highest rate recorded during this war. More than 25

percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

PATIENTS REMAINING UNDER TREATMENT, 27 October 1944

The number of neuropsychiatric cases remaining was reported at 19,900 or about 500 less than for the previous week, which had been the peak number during this war. The number of non-battle injury patients remaining totaled about 30,900. The number of battle casualty patients remaining increased by about 900 to number 24,158.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 27 October there were 4,786 enlisted men discharged by CDD or about 200 less than the previous week. About 50 percent of these discharges were reported by General Hospitals. Included among the 4,786 CDD's were 1,705 neuropsychiatric cases, as compared with 1,921 such cases among the previous week's CDD's.

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 29 SEPTEMBER 1944

VENEREAL DISEASE ADMISSION RATES

This Supplementary Health Report presents a study of venereal disease admission rates by color for all the stations in the continental United States reporting on Form 86ab. The data cover the five week period ending 29 September 1944 and are shown for individual stations only where the colored male strength was 1000 or more, the data for all other units in each Service Command being shown combined.

In considering morbidity from venereal diseases during September, reference should be had to the Supplementary Health Report contained in the Weekly Health Report for the week ending 20 October 1944, in which the September venereal disease admission rates for all Army personnel combined are shown for individual stations. On page 36 of that report there are set forth the numbers of cases remaining under treatment at the end of the month in each Service Command.

The venereal cases remaining under treatment at the end of September accounted for 1.97 percent of all types of cases under treatment. The days lost due to venereal diseases during the five week period ending 29 September 1944 totaled about 119,000 or an average of almost 24,000 per week, representing a non-effective rate of .90 per thousand. Of the 119,000 days lost due to venereal diseases, about 48,000 days were attributable to colored males. The resulting non-effective rate from venereal diseases for colored males was 4.5 per thousand, while for all other personnel it was only .59 per thousand.

As compared with August, the non-effective rate from venereal diseases increased in September by about

5 percent. This increase was due entirely to other than colored male personnel, since the rate for colored males remained substantially the same. This is the second successive month that the non-effective rate from venereal diseases has increased moderately, interrupting the previous consistently downward trend of the early months of the year. Nonetheless, the current level of the non-effective rate from venereal diseases is about 45 percent under that for January 1944. For colored males the corresponding decrease has been about 35 percent, while for the remainder of the Army almost 50 percent.

In considering the variations in venereal non-effective rates by Service Command, it should be kept in mind that such variations reflect not only differences in non-effectiveness between Service Commands, but also to some extent the differences in the extent of the General Hospital facilities in each Service Command. This is especially true of the Military District of Washington, which has an unusually low venereal rate, but because of the location of Walter Reed G.H. in this Command, reports a relatively high venereal non-effective rate.

For all Army personnel combined morbidity from venereal diseases (excluding cases contracted prior to entry on active service which are designated hereafter as EPTS) was at a rate of 37 per thousand in September or slightly higher than in August. For colored males the September rate was 165 per thousand or about 5 percent lower than in August, while for all other Army personnel the September rate was only 26 per thousand which was 10 percent higher than in August. Morbidity

VENEREAL DISEASE ADMISSION RATES (CONT'D)

of colored male personnel from venereal diseases has thus continued to be about 7 times as high as for all other Army personnel.

The September admission rate for syphilis excluding EPTS cases, was about 12 times higher for colored males than for other Army personnel, whereas for gonorrhea excluding EPTS cases the rate for colored males was only about 5 times as high. Venereal diseases other than gonorrhea and syphilis excluding EPTS cases were practically all reported among colored males who accounted for over 80 percent of such cases although representing less than 10 percent of the total strength of the Army. The admission rate from such venereal diseases was 11 per thousand for colored males (which is notably lower than in previous months when it had been about 14 per thousand) as contrasted with only .2 per thousand for the remainder of the Army.

For all Army personnel combined morbidity due to venereal EPTS cases, which were predominantly syphilis, was at a rate of 8 per thousand in September, with corresponding figures of 63 and 4 per thousand for colored males and the remainder of the Army, respectively. Variations in the admission rate for venereal EPTS cases reflect entirely the experience among current inductees, so that differences in the incidence of such cases by Service Command or by individual station have little significance. Quite naturally, reception centers report very high rates of admission from venereal EPTS cases, whereas other stations usually show few cases or none at all.

For the first time since March 1944, when these special studies on venereal disease admission rates by color were first made, the Second Service Command did not report the highest morbidity for colored males

from venereal diseases excluding EPTS cases, being outranked by the Sixth Service Command (see chart on page 29). The September rate of 223 per thousand for this Service Command was about 40 percent higher than the September rate for the colored males in the country as a whole. The corresponding admission rate for the Second Service Command was 215 per thousand or only slightly lower than that for the Sixth Service Command. The Military District of Washington, with a rate of 120 per thousand, reported the lowest morbidity from these causes among colored males, followed by the First, Third, and Seventh Service Commands all with rates of about 135 per thousand.

For other Army personnel there was relatively little variation by Service Command in morbidity from venereal diseases, excluding EPTS cases. The Fifth Service Command with a rate of 45 per thousand or almost double that for the country as a whole had by far the highest admission rate. The only other Service Command reporting morbidity notably in excess of the average for the country as a whole was the Sixth Service Command with a rate of 35 per thousand. The lowest morbidity was registered by the Military District of Washington (12 per thousand), followed by the Ninth Service Command (21 per thousand).

For colored males the following stations reported admission rates in excess of 300 per thousand from total venereal diseases excluding EPTS cases: Camp Shanks, N.Y., Camp Butner, N.C., Camp Joseph T. Robinson, Ark., Camp Livingston, La., Fort Sam Houston Tex. and Camp Beale, Calif. Most of these stations also reported relatively high morbidity in August.

The highest admission rates for syphilis excluding EPTS cases were reported from Camp Shanks, N.Y. (95 per thousand), Camp Van Dorn, Miss. (73 per thousand), and Camp Beale, Calif. (72 per thousand).

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE CALENDAR MONTH OF SEPTEMBER 1944

ANALYSIS OF INJURIES

NATURE OF THE DATA:

The data regarding injuries to military personnel presented here are based on reports (WD AGO Form 508) rendered in accordance with the provisions of WD Circular No. 252, 20 June 1944. The first reports were required for the calendar month of July, but because of the newness of the reporting system a number of reports with apparent errors or incompleteness were received even in September. In addition, a few reports were not available in time for the tabulation of the data.

It should be mentioned that the injuries reported by many installations in September did not include readmitted injuries or injuries occurring prior to entry on active service. On the other hand, the injuries reported by all Stations in the Statistical Health Reports (WD MD Form 86ab) have included such injuries with injury admissions. For this and other reasons the injury admission rate computed from Forms 86ab (as in the chart on page 38) is higher than that based on Forms 508. However, in October and subsequent months the injury figures from the two sets of reports should be more comparable, since a letter (dated 29 September 1944) has been sent to Headquarters of each Service Command indicating that the reportable injuries on both sets of forms should cover only "new" injuries.

The reports on WD AGO Form 508 cover all military personnel at Class I, II, and IV installations with a military strength of 25 or more. AAF personnel at such installations are included, but all personnel of Class III installations regardless of arm or service are excluded, being covered by the separate reporting system of the AAF. The reports deal with admissions

for injury during a calendar month; except for the exclusion of readmitted injuries and EPTS injuries the terms "admission" and "injury" are used as in the Statistical Health Report, WD MD Form 86ab (see Nature of the Data on page 2 of this report).

For purposes of reporting, military personnel are classified according to whether or not attached for medical care to the reporting medical installation. Injuries are classified primarily as to whether they were sustained on duty or off duty (i.e. on leave, pass, furlough, or AWOL). Injuries are further classified according to type of injury, nature of activity, causative agent, and unsafe condition or act.

In general, the analysis of injuries is confined to injuries sustained while on duty and to military personnel attached for medical care to the reporting installations, because only such injuries are subject to effective control by military authorities. Since the frequency of particular types of injuries depends to a large extent on the nature of the activities carried on within the Service Command or station, no definite conclusions may be drawn from differences in rates (or percentage distributions of injuries) by type of injury, causative agent, etc. unless the nature and the extent of particular forms of activity are also taken into account.

ANALYSIS OF THE DATA:

Because of the incompleteness of the data, previously mentioned, the following analysis will rely chiefly upon percentage distributions and relative comparisons rather than with actual numbers of ad-

ANALYSIS OF INJURIES (CONT'D)

missions or admission rates. The September data included in the analysis covers about 97 percent of the total strength of the installations from which reports should have been received.

As shown in the chart on page 38, the admission rate from injury at the installations covered by these reports decreased from about 100 per thousand strength per year in July and August 1943 to a level of about 70 per thousand from December 1943 to April 1944 but has since increased slightly to 75 per thousand during the period from June through September.

Analysis of Admissions by Duty Status:

In respect to personnel attached for medical care to the reporting installation 88 percent of the injury admissions were sustained on duty. On the other hand, for unattached personnel only about 30 percent were sustained on duty. For both attached and unattached personnel combined, off duty injuries accounted for 15 percent of all injury admissions. The admissions for attached personnel represented 94 percent of all injury admissions (irrespective of duty status).

Analysis of Deaths by Duty Status:

For attached personnel about 75 percent of the reported deaths were on duty, while among the unattached personnel the corresponding proportion was only about 30 percent. Of the total reported deaths (irrespective of duty status) about 80 percent were among attached personnel. Included among the reported deaths were 10 suicides; these accounted for about 10 percent of all such deaths.

Analysis of Admissions by Type of Injury:

About 70 percent of the on duty injuries among attached personnel were represented by wounds, fractures, or sprains (including strains and overexertion) with an

almost equal proportion of cases falling within each of these three categories (see table on page 39). As would be expected, most of the admissions for reaction to drug, serum, or anesthetic (2.9 percent of the total admissions) were reactions to immunization and occurred at reception centers and staging areas. There was relatively little difference between Service Commands for the various categories except for injuries due to the effects of heat, of which the great majority were reported by the Fourth Service Command, as might have been anticipated.

Analysis of Admissions by Nature of Activity:

About 85 percent of the on duty injuries among attached personnel occurred while engaged in scheduled activities. The greatest number occurred on work details which accounted for 17 percent of all on duty injuries, followed by field problems (15 percent), drills or marches (8 percent), and supervised athletics (8 percent).

Analysis of Admissions by Causative Agent:

Almost 50 percent of the on duty injuries among attached personnel were caused by agents other than those specifically listed in the report. The only causative agent showing a relatively large proportion was terrain (22 percent). Admissions from land vehicles, not armored (i.e. chiefly automobiles and trucks) accounted for only 7 percent of the total admissions. The relatively low proportion of aircraft injuries was to be expected because of the exclusion of most AAF personnel from the reporting system.

Analysis of Admissions by Unsafe Condition or Act:

In 75 percent of the on duty injuries among attached personnel no unsafe condition or unsafe act was reported to have been found. Of the remaining cases about half were reported to be due to unsafe conditions and about half due to unsafe acts.

ANALYSIS OF INJURIES (CONT'D)

Analysis by Service Commands and Technical Services:

On page 41 there appears a summary of the number of cases and annual rates of admission and of death from injury classified according to duty status and separately for attached and unattached personnel. In connection with the injury deaths shown, it should be kept in mind that only deaths from injuries incurred during the month of September and only those which took place at the reporting installation have been reported; thus, only about half of the total injury deaths which occurred during this period and were reported on Form 86ab were recorded on Form 508.

Installations assigned for safety supervision to the Chiefs of Chemical Warfare Service, Ordnance, and Transportation Corps have been shown separately in the following analysis, with all other reporting installations in the Service Commands being considered as under the Service Command.

The annual admission rate for injuries occurring to attached personnel on duty varied from a low of about 35 per thousand in the First, Second, Third, and Sixth Service Commands to a high of 73 per thousand in the Fourth Service Command. The Chemical Warfare Service installations reported a somewhat higher rate than the U.S. average. The injury rate at installations assigned to Ordnance was close to the average for the entire country, while the Transportation Corps installations showed a notably lower rate.

The admission rate for off duty injuries to attached personnel did not vary widely as between Service Commands, considering the relatively small numbers of cases involved. The admission rate for injuries to unattached personnel showed considerable variation by Service Command; the highest rate was reported by the Second Service Command which in New York City has considerable military personnel away from their regular stations.

On pages 42 and 43 there are presented the detailed

analyses by Service Command or Technical Service of on duty injuries to attached personnel according to type of injury, nature of activity, causative agent, and unsafe condition or act.

It will be noted that the relatively high injury rate in the Fourth Service Command occurred because of high incidence of training activities (drill or march, obstacle course, physical training, and field problems). Chemical Warfare Service naturally showed a relatively high admission rate of injury from inhalation or aspiration, from field problems, and from chemicals. Both the Fourth Service Command and Ordnance showed relatively high rates of injury attributable to terrain. These findings indicate that the injury rates reflect the chief types of activity in the Service Command or Technical Service.

Analysis of Data by Stations:

On pages 44 to 51 there are presented analyses of on duty injuries to attached personnel for selected individual stations. For each of the Service Commands there are shown only those stations which had a mean strength of at least 20,000, while for the Technical Services all stations with 3,000 or more strength are shown. In making comparisons between stations the different nature and the varying extent of activities at the stations should be taken into consideration as well as the fact that a few stations have continued to report readmitted and EPTS injuries.

The following stations reported the highest admission rates for on duty injuries to attached personnel: Camp Blanding, Fla., Camp Croft, S.C., Camp Joseph T. Robinson, Ark. and Camp Roberts, Calif. all of which had rates of at least 100 per year per thousand. Stations reporting exceptionally low admission rates were Camp Reynolds, Pa., Fort Dix, N.J., Fort Lewis, Wash., Fort Hamilton, N.Y. (Trans.), Fort Mason, Calif. (Trans.), and New York PoE, N.Y. (Trans.), all of which had rates of 25 per thousand or less.
